

Brain Injury Rehabilitation

ICD's Brain Injury Rehabilitation Program treats adults with acquired brain injuries resulting from head trauma, stroke, seizure disorders, brain tumors, or other events. ICD's Brain Injury Rehabilitation program is highly regarded for our staffs' expertise in treating the complex needs of adults with acquired brain injuries, including co-existing medical and psychiatric disorders. ICD's person-centered program integrates rehabilitation services with mental health, speech and hearing services, physical therapy, cognitive remediation, neurology, occupational therapy, primary care, optometry, and other services as needed.

For a list of recent research on the subject of brain injury and coexisting behavioral health disorders, see the attached PDF. TBI References

For people with cognitive deficits who want to recover from chemical dependency, ICD provides specialized addiction recovery services.

Brain Injury and Addiction Recovery

Each client at ICD has a primary therapist who develops a personal treatment plan, provides counseling and coordinates services. Through an array of services, including individual and group therapies, clients work toward reintegrating into the community through employment, volunteer work, education and/or increased leisure and social activities. This personal attention ensures that clients are involved in their own rehabilitation and are more likely to succeed.
